No More Mosquito Bites!

IN ADDITION to being nuisance pests, mosquitoes are a serious public health threat. They can transmit life-threatening diseases such as West Nile virus! Every year in Tennessee there are news reports about people being afflicted with the West Nile virus, which can be a very serious illness, sometimes resulting in death.

The way to help minimize the risk of getting bitten by mosquitoes is to use Dayton's Mosquito Control Management Program, offered from May through October. Spraying mosquito repellants for protection can help, but it does not address the breeding sites of mosquitoes or eliminate them from your yard!

The professionals at Dayton's are trained in identifying specific areas to treat for achieving effective mosquito control. A major benefit of using Dayton's Mosquito Control Management Program is that this treatment kills existing mosquitoes plus prevents mosquito immatures and eggs from becoming biting adults. Be watchful and eliminate standing water in potential breeding sites such as clogged rain gutters, flowerpot saucers, wheelbarrows, and watering cans.

Examples of treatment areas include standing water, waterscapes, and mosquito resting areas like landscaping, vegetation, trees, and shrubs.

New customers will receive a special \$25 discount on initial service for Dayton's Mosquito Control Management Program with a six month contract from May through October. Other services provided by Dayton's include pest control for carpenter bees/ants/ladybugs/bedbugs, convenient quarterly perimeter pest control, monthly/quarterly/one-time pest control services, fungicide/moldicide treatments, VA/FHA inspections, CleanSpace® Crawl Space Encapsulation System, and radon testing/mitigation.
